Abstract:
Flexible Packaging print-shops are still predominantly using solvent based inks. However, the drivers to reduce their solvent emissions are increasing. Therefore printers try to find alternatives for solvent-based inks to solve their legislation and explosion issues in a sustainable way.

The Joncryl® FLX Line is suitable for both surface print as well as reverse print. In surface print applications good resistance properties are achieved combined with an excellent printability. Applied in reverse printing lamination applications for structures based and OPP, PET and/or PE, the Joncryl® FLX Line combines good lamination bond strength with good printability properties.

The Joncryl® FLX Line for flexible packaging inks makes it possible to convert an increasing part of the flexible packaging market from solvent-based to water-based inks in a cost-effective and eco-efficient way.
